EDUCATION

Boston University

Boston, MA

Bachelor of Arts in Computer Science

Expected Graduation: June 2026 | GPA: 3.53

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases, OOP

EXPERIENCE

Software Engineer

September 2025 – Present

Ezesports

New York, NY

- Migrating esports league platform from Google Sites to Next.js with Supabase backend, enabling dynamic schedules, live scoring, and automated season management to replace manual content updates
- Designing PostgreSQL database schema supporting 500+ matches across 20+ teams with RESTful API endpoints for player statistics, team standings, and historical data retrieval
- Deploying application on Cloudflare Pages with CI/CD pipeline, achieving 75% reduction in page load time (3.2s to 0.8s) through code splitting and edge caching

Software Developer

September 2024 – December 2024

Boston University Spark!

Boston, MA

- Developed food waste reduction platform connecting students with leftover event food, implementing dual authentication (Django + Auth0 OAuth), QR code email delivery system, and many-to-many reservation management with real-time capacity tracking
- Integrated Google Maps JavaScript API for interactive event discovery with user geolocation and distance calculations, implementing multi-criteria filtering across 18 food categories and 8 allergen types using Django class-based views with form validation
- Deployed production Django application with WhiteNoise static file serving and automated Gmail SMTP notifications featuring inline QR code attachments, managing SQLite database with 100+ campus events while implementing comprehensive security features including CSRF protection and input validation

PROJECTS

Whisperrr | whisperrr.shangmin.me | *Spring Boot, FastAPI, React, Tailwind CSS*

January 2026

- Built full-stack transcription platform processing audio 4x faster than baseline OpenAI Whisper API, supporting 99+ languages across multiple audio formats with real-time results
- Designed three-tier stateless architecture with HTTP connection pooling to reduce request latency by 70%, improving reliability for files over 25MB from 60% to 100% success rate
- Containerized microservices with Docker Compose health checks and implemented segment-level timestamp generation for subtitle creation at 32x realtime speed

Crime-Mapper Boston | crime-mapper.shangmin.me | *Python, Prophet, Streamlit, Scikit-learn*

December 2025

- Developed crime forecasting system analyzing 204,356 incidents across 14 Boston districts using Facebook Prophet time series model, achieving 59.9% improvement over naive baseline in optimal districts
- Implemented automated model evaluation comparing Prophet against 3 baseline methods (seasonal naive, moving average, linear regression) with reliability indicators when simpler models perform better
- Deployed interactive dashboard with DBSCAN spatial clustering for hotspot identification, automatic API data refresh, and 2-month crime forecasts with confidence intervals

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, HTML/CSS, SQL

Frameworks: Next.js, React, Spring Boot, Django, FastAPI, Streamlit, Tailwind CSS

Tools: Supabase, PostgreSQL, Docker, Git, Cloudflare Pages, Auth0, Google Maps API, Nginx
