EDUCATION

Boston University

Bachelor of Arts in Computer Science

Boston, MA

Graduated: Spring 2026

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases, Machine Learning, Data Science.

EXPERIENCE

Software Engineering Intern

February 2026 – June 2026

RESET Standard

Shanghai, China

- Doubled the platform's supported environmental data categories (from 2 to 4) by independently implementing end-to-end water and waste data integration, developing Rails backend ingestion pipelines, PostgreSQL schemas, and client-facing React/Vite/Tailwind dashboards.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, decoupling external API calls from user-facing requests.
- Redesigned project-device mapping workflows in response to client requests, refactoring legacy forms to streamline onboarding of environmental monitoring devices.

Lead Product Engineer

December 2025 – Present

EZ Esports

New York, NY

- Designed a PostgreSQL schema on Supabase using Drizzle ORM, supporting 500+ matches across 20+ teams, and built RESTful endpoints for player statistics, standings, and historical data.
- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Cut page load time by 75% (from 3.2s to 0.8s) by implementing edge caching on Cloudflare, route-based code splitting, and asset optimization for the Next.js frontend.

PROJECTS

Persephone | *Python, Cython/C++17, Rust, Modal, FAISS*

May 2026

- Built and operated a live Kalshi BTC prediction-market trading system end to end (market-data ingestion, theoServing, strategy evaluation, execution, and risk), generating \$8K net PnL on \$200K traded volume in its first 4 days.
- Prevented bad-price quoting with fail-closed gates that block stale, crossed, or untrusted market data before quote generation, computing fused market metrics in $357\mu\text{s}$ p50 across 8 venues.
- Replaced KDE inference with a GBM theoS layer, cutting model query latency from $\sim 1.5\text{ms}$ to $\sim 20\mu\text{s}$ per query ($\sim 75\times$) behind an unchanged live serving interface.
- Cut backtest and parameter-sweep iteration from ~ 14 hours on laptop CPUs to ~ 15 minutes by moving tick backtests and sweeps to Modal NVIDIA GPU workers with FAISS GPU search and CuPy-vectorized math.
- Eliminated duplicate-send and crash-replay risk with a durable-before-wire order layer: intent journaled before dispatch, deterministic client IDs for idempotent retries, and persisted ack state for reconciliation.

Hermes Letters | *Next.js, TypeScript, Supabase, Drizzle ORM, PostgreSQL*

June 2026

- Built a private long-form messaging platform for a group of 20+ friends during a study abroad semester, delivering 30+ letters.
- Ensured consistent letter claims via atomic SQL updates and secured sessions in XSS-resistant httpOnly cookies.
- Derived user connections at query time from kept-letter records using indexed lookups, avoiding a separate relationship table and associated database sync issues.

TECHNICAL SKILLS

Languages: Python, C++17, Cython, Rust, TypeScript, JavaScript, Java, Ruby, SQL

Frameworks & Libraries: React, Next.js, Node.js, Vite, React Native, Ruby on Rails, Django, Spring Boot, FastAPI, Tailwind CSS, FAISS, CuPy

Databases & Infrastructure: PostgreSQL, SQLite, Redis, RabbitMQ, Sidekiq, Supabase, Docker, Nginx, Cloudflare, Modal, OpenMP
