EDUCATION

Boston University

Boston, MA

Bachelor of Arts in Computer Science, GPA: 3.53

Graduated: Spring 2026

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases.

PROJECTS

Persephone | *Python, Cython, Rust, FastAPI, React/TypeScript, Kalshi, Low-Latency*

May 2026

- Built and launched a production Kalshi prediction-market trading system that generated ~\$8K net PnL over its first 4 days of live trading and traded ~\$200K in volume across model-driven quoting, exchange execution, risk controls, and operator tooling.
- Cut live hot-path latency by rewriting 9 performance-critical Python kernels into native Cython extensions for orderbook processing, OBI evaluation, RTI/event aggregation, threshold storage, and theo prediction.
- Built fail-closed market-data infrastructure that blocks stale, crossed, overflowed, or low-venue feeds before they reach the quoting path, using trusted-spot checks and venue-health state machines.
- Built a write-ahead order safety layer that records order intent before exchange dispatch, reducing duplicate-send and crash-replay risk with deterministic client IDs, final risk gates, and durable execution records.
- Prevented unsafe model and release promotion with walk-forward validation, Brier/reliability gates, SHA-256 model manifests, immutable release artifacts, latency SLOs, and shadow-readiness checks.
- Implemented a 14-crate Rust replacement core for deterministic low-latency execution, using fixed-point arithmetic, typed event protocols, replay-golden tests, allocation audits, and canonical state digests.

Hermes Letters | *Next.js, TypeScript, Supabase, Drizzle ORM, PostgreSQL*

June 2026 – Present

- Built a private long-form messaging platform for a group of 20+ friends during a study abroad semester, delivering 30+ letters.
- Ensured consistent letter claims via atomic SQL updates and secured sessions in XSS-resistant httpOnly cookies.
- Derived user connections at query time from kept-letter records using indexed lookups, avoiding a separate relationship table and associated database sync issues.
- Hardened media storage by validating uploads via server-side magic-byte signatures, storing files in a private Supabase bucket, and restricting delivery to 1-hour signed URLs.

EXPERIENCE

Software Engineering Intern

February 2026 – June 2026

RESET Standard

Shanghai, China

- Built React components with Vite, Tailwind CSS, and shadcn/ui for Reset, an environmental data platform serving client-facing analytics dashboards.
- Developed Ruby on Rails services that ingest and normalize third-party environmental datasets into PostgreSQL, designing schemas and ActiveRecord models for large-scale querying.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, decoupling external API calls from user-facing requests.

Technical Director

December 2025 – Present

Ezesports

New York, NY

- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Designed a PostgreSQL schema supporting 500+ matches across 20+ teams and built RESTful endpoints for player statistics, team standings, and historical data retrieval.
- Deployed the application on Cloudflare Pages with a CI/CD pipeline, reducing page load time by 75% (3.2s to 0.8s) through code splitting and edge caching.

TECHNICAL SKILLS

Languages: Rust, Cython, Python, TypeScript, JavaScript, Java, Ruby, SQL, HTML/CSS

Frameworks & Libraries: Next.js, React, FastAPI, Vite, Tailwind CSS, shadcn/ui, Ruby on Rails, Drizzle ORM

Databases & Infrastructure: PostgreSQL, Supabase, Redis, RabbitMQ, Sidekiq, Docker, Git, Cloudflare
