## EDUCATION

### Boston University

Boston, MA

*Bachelor of Arts in Computer Science*

*August 2026*

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases, Machine Learning, Data Science.

## EXPERIENCE

### Lead Software Engineer

December 2025 – Present

*EZ Esports*

*New York, NY*

- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Designed a PostgreSQL schema on Supabase using Drizzle ORM, supporting 500+ matches across 20+ teams, and built RESTful endpoints for player statistics, standings, and historical data.
- Cut page load time by 75% (from 3.2s to 0.8s) by implementing edge caching on Cloudflare, route-based code splitting, and asset optimization for the Next.js frontend.

### Software Engineering Intern

February 2026 – June 2026

*RESET Standard*

*Shanghai, China*

- Doubled the platform's supported environmental data categories (from 2 to 4) by independently implementing end-to-end water and waste data integration, developing Rails backend ingestion pipelines, PostgreSQL schemas, and client-facing React/Vite/Tailwind dashboards.
- Redesigned project-device mapping workflows in response to client requests, refactoring legacy forms to streamline onboarding of environmental monitoring devices.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, decoupling external API calls from user-facing requests.

## PROJECTS

### Persephone | *Python, Cython/C++17, Rust, Modal, FAISS*

May 2026

- Built and operated a live Kalshi BTC prediction-market trading system end to end (market-data ingestion, theo serving, strategy evaluation, execution, and risk), generating \$8K net PnL on \$200K traded volume in its first 4 days.
- Replaced KDE inference with a GBM theo layer, cutting model query latency from  $\sim 1.5\text{ms}$  to  $\sim 20\mu\text{s}$  per query ( $\sim 75\times$ ) behind an unchanged live serving interface.
- Eliminated duplicate-send and crash-replay risk with a durable-before-wire order layer: intent journaled before dispatch, deterministic client IDs for idempotent retries, and persisted ack state for reconciliation.

### Hermes Letters | *Next.js, TypeScript, Supabase, Drizzle ORM, PostgreSQL*

June 2026

- Built a private long-form messaging platform for a group of 20+ friends during a study abroad semester, delivering 30+ letters.
- Ensured consistent letter claims via atomic SQL updates and secured sessions in XSS-resistant httpOnly cookies.
- Derived user connections at query time from kept-letter records using indexed lookups, avoiding a separate relationship table and associated database sync issues.
- Hardened media storage by validating uploads via server-side magic-byte signatures, storing files in a private Supabase bucket, and restricting delivery to 1-hour signed URLs.

## TECHNICAL SKILLS

**Languages:** TypeScript, JavaScript, Python, SQL, C++17, Ruby, Java, Cython, Rust

**Frameworks & Libraries:** React, Next.js, Node.js, Vite, Tailwind CSS, FastAPI, Ruby on Rails, Django, React Native, Spring Boot, FAISS, CuPy

**Databases & Infrastructure:** PostgreSQL, Supabase, Redis, RabbitMQ, Docker, Cloudflare, Sidekiq, SQLite, Nginx, Modal, OpenMP
