## EDUCATION

### Boston University

Boston, MA

*Bachelor of Arts in Computer Science*

*Graduated: Spring 2026*

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases, Machine Learning, Data Science.

## EXPERIENCE

### Software Engineering Intern

February 2026 – June 2026

*RESET Standard*

*Shanghai, China*

- Redesigned project-device mapping workflows in response to client requests, refactoring legacy forms to streamline onboarding of environmental monitoring devices.
- Doubled the platform's supported environmental data categories (from 2 to 4) by independently implementing end-to-end water and waste data integration, developing Rails backend ingestion pipelines, PostgreSQL schemas, and client-facing React/Vite/Tailwind dashboards.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, decoupling external API calls from user-facing requests.

### Lead Product Engineer

December 2025 – Present

*EZ Esports*

*New York, NY*

- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Designed a PostgreSQL schema on Supabase using Drizzle ORM, supporting 500+ matches across 20+ teams, and built RESTful endpoints for player statistics, standings, and historical data.
- Cut page load time by 75% (from 3.2s to 0.8s) by implementing edge caching on Cloudflare, route-based code splitting, and asset optimization for the Next.js frontend.

## PROJECTS

### Persephone | Python, Cython/C++17, Rust, Modal, FAISS

May 2026

- Built and operated a live Kalshi BTC prediction-market trading system end to end (market-data ingestion, theo serving, strategy evaluation, execution, and risk), generating \$8K net PnL on \$200K traded volume in its first 4 days.
- Eliminated duplicate-send and crash-replay risk with a durable-before-wire order layer: intent journaled before dispatch, deterministic client IDs for idempotent retries, and persisted ack state for reconciliation.
- Replaced KDE inference with a GBM theo layer, cutting model query latency from  $\sim 1.5\text{ms}$  to  $\sim 20\mu\text{s}$  per query ( $\sim 75\times$ ) behind an unchanged live serving interface.
- Rewrote 9 live hot-path kernels (order-book maintenance, order-book imbalance, trade intensity, event aggregation) as native Cython extensions, cutting Kalshi book maintenance from 21.8ms to 195 $\mu\text{s}$  p50 (112x).

### Whisperrr | Java Spring Boot, Python FastAPI, React, PostgreSQL / Tailwind CSS

September 2025

- Built full-stack transcription platform processing audio at 32x realtime speed, supporting 99+ languages across multiple audio formats with real-time results
- Designed three-tier stateless architecture with HTTP connection pooling to reduce request latency by 70%, improving reliability for files over 25MB from 60% to 100% success rate

### Personal Portfolio | React 19, Vite, Cloudflare Workers, Cloudflare R2, JavaScript

July 2026

- Run the site as a single Cloudflare Workers deployment serving static assets plus 4 same-origin API routes, holding upstream credentials in Worker secrets and absorbing repeat traffic at the edge cache so no third-party key or CORS dependency reaches the browser.
- Decoupled publishing from deploys by serving gallery photos and their JSON manifest from R2 through the Worker, with a sharp preprocessing step emitting 1800px and 700px derivatives so new albums go live without a rebuild.

## TECHNICAL SKILLS

**Languages:** Python, C++17, JavaScript, TypeScript, Java, SQL, Cython

**Frameworks & Libraries:** React, Next.js, FastAPI, Vite, Node.js, Django, Tailwind CSS

**Databases & Infrastructure:** PostgreSQL, Cloudflare, Docker, Redis, RabbitMQ, Supabase, Nginx
