EDUCATION

Boston University

Boston, MA

Bachelor of Arts in Computer Science

Graduated: Spring 2026

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases, Machine Learning, Data Science.

EXPERIENCE

Software Engineering Intern

February 2026 – June 2026

RESET Standard

Shanghai, China

- Doubled the platform's supported environmental data categories (from 2 to 4) by independently implementing end-to-end water and waste data integration, developing Rails backend ingestion pipelines, PostgreSQL schemas, and client-facing React/Vite/Tailwind dashboards.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, decoupling external API calls from user-facing requests.
- Redesigned project-device mapping workflows in response to client requests, refactoring legacy forms to streamline onboarding of environmental monitoring devices.

Lead Product Engineer

December 2025 – Present

EZ Esports

New York, NY

- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Designed a PostgreSQL schema on Supabase using Drizzle ORM, supporting 500+ matches across 20+ teams, and built RESTful endpoints for player statistics, standings, and historical data.
- Cut page load time by 75% (from 3.2s to 0.8s) by implementing edge caching on Cloudflare, route-based code splitting, and asset optimization for the Next.js frontend.

PROJECTS

Personal Portfolio | *React 19, Vite, Cloudflare Workers, Cloudflare R2, JavaScript*

July 2026

- Cut initial JS 54% (187KB to 87KB gzipped) by code-splitting Recharts behind a lazy boundary with manual Rollup chunks, deferring the charting bundle until the stats panel actually mounts.
- Run the site as a single Cloudflare Workers deployment serving static assets plus 4 same-origin API routes, holding upstream credentials in Worker secrets and absorbing repeat traffic at the edge cache so no third-party key or CORS dependency reaches the browser.
- Decoupled publishing from deploys by serving gallery photos and their JSON manifest from R2 through the Worker, with a sharp preprocessing step emitting 1800px and 700px derivatives so new albums go live without a rebuild.
- Made repeat navigation network-free with a two-tier client cache (module memory plus sessionStorage) and in-flight promise deduping that collapses concurrent component mounts onto a single request.

Hermes Letters | *Next.js, TypeScript, Supabase, Drizzle ORM, PostgreSQL*

June 2026

- Built a private long-form messaging platform for a group of 20+ friends during a study abroad semester, delivering 30+ letters.
- Ensured consistent letter claims via atomic SQL updates and secured sessions in XSS-resistant httpOnly cookies.
- Derived user connections at query time from kept-letter records using indexed lookups, avoiding a separate relationship table and associated database sync issues.
- Hardened media storage by validating uploads via server-side magic-byte signatures, storing files in a private Supabase bucket, and restricting delivery to 1-hour signed URLs.

TECHNICAL SKILLS

Languages: Python, C++17, Cython, Rust, TypeScript, JavaScript, Java, Ruby, SQL

Frameworks & Libraries: React, Next.js, Node.js, Vite, React Native, Ruby on Rails, Django, Spring Boot, FastAPI, Tailwind CSS, FAISS, CuPy

Databases & Infrastructure: PostgreSQL, SQLite, Redis, RabbitMQ, Sidekiq, Supabase, Docker, Nginx, Cloudflare, Modal, OpenMP
