EDUCATION

Boston University

Boston, MA

Bachelor of Arts in Computer Science

Graduated: Spring 2026

- Relevant Coursework: Data Structures & Algorithms, Operating Systems, Distributed Systems, Databases.

EXPERIENCE

Ezesports

New York, NY

Technical Director / Software Engineer

December 2025 – Present

- Migrated an esports league platform from Google Sites to Next.js with a Supabase backend, replacing manual content updates with live scoring and automated season management.
- Designed a PostgreSQL schema on Supabase using Drizzle ORM to support over 500 matches across 20 teams, and built RESTful endpoints for player statistics, standings, and historical data.
- Cut page load time by 75 percent, dropping from 3.2s down to 0.8s, by implementing edge caching on Cloudflare, route-based code splitting, and asset optimization for the Next.js frontend.

RESET Standard

Shanghai, China

Software Engineering Intern

February 2026 – June 2026

- Doubled the platform's supported environmental data categories from 2 to 4 by independently implementing end-to-end water and waste data integration, developing Rails backend ingestion pipelines, PostgreSQL schemas, and client-facing React and Vite dashboards.
- Engineered asynchronous data pipelines with RabbitMQ, Redis, and Sidekiq to process long-running ingestion jobs in the background, which successfully decoupled external API calls from user-facing requests.
- Implemented a key client-requested feature by redesigning project-device mapping workflows, refactoring legacy forms to streamline the onboarding of environmental monitoring devices.

PROJECTS

Persephone | Python, Cython/C++17, Rust, Modal, FAISS

May 2026

- Built and operated a production Kalshi Bitcoin prediction-market trading system that generated 8K dollars net PnL and traded 200K dollars in volume during its first 4 live days, owning market-data ingestion, evaluation, and risk gates.
- Engineered a GBM layer to replace inference bottlenecks, reducing model query latency from 1.5ms to 20 microseconds per query, a 75x improvement, while preserving live evaluation interfaces.
- Moved 9 live hot-path kernels into native Cython extensions for order-book maintenance and event aggregation, cutting Kalshi book maintenance from 21.8ms to 195 microseconds.
- Built a compiled Cython and C++17 SPSC event ring with cache-line-aligned atomic cursors, single-producer enforcement, and native ring-to-aggregator drains benchmarked at 584ns enqueue times.

Audio Transcription Platform (Whisperrr) | Spring Boot, FastAPI, React, PostgreSQL

September 2025

- Built a full-stack transcription platform processing audio four times faster than the baseline OpenAI Whisper API, supporting 99 languages across multiple audio formats with real-time results.
- Designed a three-tier stateless architecture with HTTP connection pooling to reduce request latency by 70 percent, improving reliability for files over 25MB to a 100 percent success rate.
- Containerized microservices using Docker Compose health checks and implemented segment-level timestamp generation for subtitle creation at 32x realtime speed.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, SQL, Python, Rust, Cython, Ruby, Java, HTML/CSS

Frameworks & Libraries: Next.js, React, Drizzle ORM, FastAPI, Vite, Tailwind CSS, shadcn/ui, Ruby on Rails

Databases & Infrastructure: PostgreSQL, Supabase, Redis, RabbitMQ, Sidekiq, Docker, Cloudflare, Git
